I. INTRODUCTION

"Sports Participation in 1992: Series I" is a research program designed to measure the number of individuals seven years of age or older who participated in each of twenty-six (26) different sports within the previous year.

"Sports Participation in 1992: Series I" measures the annual number of participants in each sport, the frequency of participation (number of days of participation per year), the number of new participants, the number of individuals who participated in 1991 but not in 1992, the number of individuals who participated in both 1991 and 1992, and the average (mean) number of days of participation.

Reports included in the study are:

- Sport Summary
    - Gender and Age
    - Male Age and Education
    - Female Age and Education
    - Household Income and Market Size
    - Census Region and Presence of Children
- Participation Correlation Tables
- Individual Sports Tables

The Individual Sports Tables are generated for selected demographics, including gender, age, education of male and female household heads, household income, market size, census region and presence of children.

II. METHODOLOGY

A. Sampling

For "Sports Participation in 1992: Series I," a mail panel resource of more than 200,000 pre-recruited households was used. The panel is balanced on a number of characteristics determined to be key indicators of general purchase behavior, including household size and composition, household income, age of the household head, socio-economic status of the household, and region and market size. During the first week of January, a self-administered questionnaire was mailed to 10,000 of these households. The sample is balanced to oversample lower "return rate" segments, thereby yielding a return sample which is correctly representative of the continental United States based upon these characteristics.

B. Questionnaire

The questionnaire asked the male and female heads of household and up to two other household members who were at least seven years of age to indicate their age, the sports in which they participated in 1991 and 1992, and the number of days of participation in 1992. The sports included those listed in this report's table of contents.

In order to reduce the bias effect that is possible from the order in which the sports were listed, the list was given in alphabetic order to half of the households, and in reverse-alphabetic order to the remaining half of the households.

The response rate for the survey was 76%, yielding a final sample of 14,992 individuals for 1992.

C. Returns

The sample returns were projected using a two-step process. The first step ensured that the sample returns were correctly representative of the continental United States in terms of state of residence and market size. This was accomplished through the use of a 48-cell weighting matrix defined for both state and MSA market size.

The second step projected the weighted returns to be representative of participation in the entire continental United States. The projection matrix was defined for:

- household size
- gender of household head for single member households
- household head age for each household size break
- household income for each household head age break
- region

III. STATISTICAL NOTES

It is important to note that in basing estimates of a population on a sample drawn from that population, a degree of sampling error is possible. While a number of biases can affect the extent of sampling error, it is to a great degree dependent on the size of the sample. The larger the sample, the more closely the estimate represents the total population.

Sampling error also affects samples of the same size. A sample drawn from a population will result in an estimate for a characteristic of the population, the proportion of aerobic exercisers for example. If another sample were drawn, it would be likely to include different members of the population. This would yield a slightly different estimate of the proportion of aerobic exercisers.

To allow judgments and decisions to be made with confidence when using samples, we can determine a confidence interval for the estimate.

A confidence interval is simply a range. A 95% confidence interval for the proportion of aerobic exercisers in the population is a range in which the estimates for the proportion of aerobic exercisers would fall 95% of the time, were the study to be done repeatedly. For example, in 1992, the proportion of respondents who stated they participated in aerobic exercising was 12.1% (after weighting and projection). Thus, if we were to estimate the proportion of aerobic exercisers in the United States using 100 similar studies, 95 of those studies would yield an estimate within the 95% confidence interval of 11.6% - 12.6%, (+/-0.5%) from the stated proportion.

The confidence intervals for measurements of the proportion of participants in each sport in "Series I" do not exceed +/-1.0%.

IV. DATA INDICATED IN THE REPORTS

A. Participants

A participant is defined as an individual seven years of age or older who participates in a sport more than once within a year for all sports in "Series I" except aerobic exercising, bicycle riding, calisthenics, exercise walking, exercising with equipment, running/jogging and swimming. For these seven fitness sports, participation is defined as six times or more during the year.

Note that this study also reports the number of individuals who participated "1 Day Only in 1992" or "1-5 Days in 1992" for each sport. These are not included in "Total Respondents in 1992" for each sport as they are not "participants" as defined above. For comparative purposes, "Total Respondents in 1992" and "New in 1992" use the same definition, just as in previous years' studies.

The definition of a participant for "In 1991/Not 1992" includes those who had participated only once.

The definition of "Frequent", "Occasional" and "Infrequent" participant varies for each sport and is indicated in the report. For sports where the incidence of participation is low, participants are divided into "Frequent" and "Infrequent" only.

B. Means

Following the frequency distributions, the mean (average) number of participant days is reported for each sport. Multiplying the mean by "Total in 1992" will provide a measure for total participant days for each sport. The number of participant days for certain sports should be divided by an estimate of the number of participants who play together on a team or in an event in order to calculate the number of games, matches, etc. played.

C. Geographic Regions

The tables in this report show the demographic distribution of participants for each sport by geographic region. The states in the geographic regions are:

New England	Middle Atlantic	East North Central	West North Central	South Atlantic	East South Central	West South Central	Mountain	Pacific
CT	NJ	IL	IA	DE	AL	AR	AZ	CA
ME	NY	IN	KS	FL	KY	LA	CO	OR
MA	PA	MI	MN	GA	MS	OK	ID	WA
NH		OH	MO	MD	TN	TX	MT	
RI		WI	NE	NC			NV	
VT			ND	SC			NM	
			SD	VA			UT	
				WV			WY	
				DC				

These regions are the same as those used by the U.S. Bureau of the Census, except that Alaska and Hawaii are not included.

D. In This Report

Note that the age groupings parallel those found in "The Sporting Goods Market," also published by the National Sporting Goods Association. This allows comparisons between participation and purchases in each age group.

The data for individual activities are percentaged both horizontally and vertically. The data, therefore, include three numbers. The first (top) indicates participants in thousands. The second (middle) is the horizontal percentage. The third (bottom) is the vertical percentage.

In the following example:

- Aerobic exercising participants numbered 27,834,000 for "TOTAL RESPONDENTS IN 1992."
- 5,076,000 of these were "MALE," representing 18.2% of all participants (the horizontal percent).
- 6,786,000 of all aerobic exercising participants were "FREQUENT" participants, representing 24.4% of participants (the vertical percent).
- 1,347,000 of all aerobic exercising participants were "MALE" and were "FREQUENT" participants. This represents 19.9% of all "FREQUENT" participants (the horizontal percent) and 26.5% of all "MALE" participants (the vertical percent).

NSGA WORLD SPORTS EXPO

The very first place in the world to see next year's products!

1993 **NSGA World Sports Expo**
66th NSGA International Convention & Show
August 1-3 (Sunday-Tuesday)
McCormick Place • Chicago, Illinois
plus **The Imprinted Sportswear Show**

1994 **NSGA World Sports Expo**
67th NSGA International Convention & Show
July 17-19 (Sunday-Tuesday)
McCormick Place • Chicago, Illinois
plus **The Imprinted Sportswear Show**

1995 **NSGA World Sports Expo**
68th NSGA International Convention & Show
July 16-18 (Sunday-Tuesday)
McCormick Place • Chicago, Illinois
plus **The Imprinted Sportswear Show**

1996 **NSGA World Sports Expo**
69th NSGA International Convention & Show
July 14-16 (Sunday-Tuesday)
McCormick Place • Chicago, Illinois

1997 **NSGA World Sports Expo**
70th NSGA International Convention & Show
July 13-15 (Sunday-Tuesday)
McCormick Place • Chicago, Illinois

I. INTRODUCTION

"Sports Participation in 1992: Series II" is a research program designed to measure the number of individuals seven years of age or older who participated in each of a number of different sports within the previous year.

"Sports Participation in 1992: Series II" measures the annual number of participants in each sport, the frequency of participation (number of days of participation in 1992) and the average (mean) number of days of participation.

Reports included in the study are:

- Sport Summary
    - Gender and Age
    - Male Age and Education
    - Female Age and Education
    - Household Income and Market Size
    - Region and Presence of Children
- Participation Correlation Tables
- Individual Sports Tables

The Individual Sports Tables, like the summary tables, are generated for selected demographics, including sex, age of male and female household heads, education of male and female household heads, household income, market size, census region and presence of children.

II. METHODOLOGY

A. Sampling

For "Sports Participation in 1992: Series II," a mail panel resource of more than 200,000 pre-recruited households was used. The panel is balanced on a number of characteristics determined to be key indicators of general purchase behavior, including household size and composition, household income, age of the household head, socioeconomic status of the household, region and market size. During the first week of January, a self-administered questionnaire was mailed to 20,000 of these households. The sample is balanced to oversample lower "return rate" segments, and thereby yield a return sample which is correctly representative of the continental United States based upon these characteristics.

B. Questionnaire

The questionnaire asked the male and female heads of household and up to two other household members who were at least seven years of age to indicate their age, sports in which they participated in 1992, and the number of days of participation in 1992. The sports included those listed in this report's table of contents.

In order to reduce the bias effect that is possible from the order in which the sports were listed, the list was given in alphabetic order to half of the households, and in reverse-alphabetic order to the remaining half of the households.

The response rate for the survey was 75%, yielding a final sample of about 27,000 individuals.

C. Returns

The sample returns were projected using a two-step process. The first step ensured that the sample returns were correctly representative of the continental United States in terms of state of residence and market size. This was accomplished through the use of a 48-cell weighting matrix defined for both state and MSA market size.

The second step projected the weighted returns to be representative of participation in the entire continental United States. The projection matrix was defined for:

- household size
- gender of household head for single member households
- household head age for each household size break
- household income for each household head age break
- region

III. STATISTICAL NOTES

It is important to note that in basing estimates of a population on a sample drawn from that population, a degree of sampling error is possible. While a number of biases can affect the extent of sampling error, it is to a great degree dependent on the size of the sample. The larger the sample, the more closely the estimate represents the total population.

Sampling error also affects samples of the same size. A sample drawn from a population will result in an estimate for a characteristic of the population, the proportion of archers for example. If another sample were drawn, it would be likely to include different members of the population. This would yield a slightly different estimate of the proportion of archers.

To allow judgments and decisions to be made with confidence when using samples, we can determine a confidence interval for the estimate.

A confidence interval is simply a range. A 95% confidence interval for the proportion of archers in the population is a range in which the estimates for the proportion of archers would fall 95% of the time, were the study to be done repeatedly. For example, in 1992, the proportion of respondents who stated they participated in archery was 2.7% (after weighting and projection). Thus, if we were to estimate the proportion of archers in the United States using 100 similar studies, 95 of those studies would yield an estimate within the 95% confidence interval of 2.4% - 3.0%, (+/-0.3%) from the stated proportion.

The confidence intervals for measurements of the proportion of participants in each sport in "Series II" do not exceed +/-1.0%.

IV. DATA INDICATED IN THE REPORTS

A. Participants

A participant is defined as someone seven years of age or older who participates in a sport more than once within a year for all sports in "Series II" except step aerobics and work-out at club. For these two fitness sports, participation is defined as six times or more during the year.

Note that this study also reports the number of individuals who participated "1 Day Only in 1992" or "1-5 Days in 1992" for each sport. This number is not included in "Total Respondents in 1992" for each sport as they are not participants as defined above.

The definition of "Frequent," "Occasional" and "Infrequent" participant varies for each sport. For sports where the incidence of participation is low, participants are divided into "Frequent" and "Infrequent" only.

B. Means

Following the frequency distributions, the mean (average) number of participant days is reported for each sport. Multiplying the mean by "Total in 1992" will provide a measure for total participant days for each sport. The number of participant days for certain sports should be divided by an estimate of the number of participants who play together on a team or in an event in order to calculate the number of games, matches, etc. played.

C. Geographic Regions

The tables in this report show the demographic distribution of participants for each sport by geographic region. The states in the geographic regions are:

New England	Middle Atlantic	East North Central	West North Central	South Atlantic	East South Central	West South Central	Mountain	Pacific
CT	NJ	IL	IA	DE	AL	AR	AZ	CA
ME	NY	IN	KS	FL	KY	LA	CO	OR
MA	PA	MI	MN	GA	MS	OK	ID	WA
NH		OH	MO	MD	TN	TX	MT	
RI		WI	NE	NC			NV	
VT			ND	SC			NM	
			SD	VA			UT	
				WV			WY	
				DC				

The geographic regions are the same as those used by the U.S. Bureau of the Census, except that Alaska and Hawaii are not included.

D. In This Report

Note that the age groupings parallel those found in "The Sporting Goods Market," also published by the National Sporting Goods Association. This allows comparisons between participation and purchases in each age group.

The data for individual activities are percentaged both horizontally and vertically. The data, therefore, include three numbers. The first (top) indicates participants in thousands. The second (middle) is the horizontal percentage. The third (bottom) is the vertical percentage.

In the following example:

- Archery participants numbered 6,135,000 for "TOTAL RESPONDENTS IN 1992."

- 4,715,000 of these were "MALE," representing 76.9% of participants (the horizontal percent).

- 1,195,000 of all archery participants were "FREQUENT" participants, representing 19.5% of participants (the vertical percent).

- 1,046,000 of all archery participants were "MALE" and were "FREQUENT" participants. This represents 83.6% of all "FREQUENT" participants (the horizontal percent) and 22.2% of all "MALE" participants (the vertical percent).

I. INTRODUCTION

"Sports Participation in 1992: State by State" is a research program designed to measure the number of individuals seven years of age or older who participated in each of thirty-four (34) different sports within the previous year for each individual state in the continental United States.

"Sports Participation in 1992: State by State" measures the annual number of participants in each sport, the frequency of participation (number of days of participation per year), the total number of days of participation, and an index of participation. It is derived from two sports participation studies conducted by the National Sporting Goods Association each year: "Series I" and "Series II." Each measures the annual number of participants in each sport, the frequency of participation (number of days of participation per year), and the average (mean) number of days of participation. The "State by State" report includes only those sports from the "Series I" and "Series II" studies which had more than eight million participants.

II. METHODOLOGY

A. Sampling

For each sports participation study, a mail panel resource of more than 200,000 pre-recruited households was used. The panel is balanced on a number of characteristics determined to be key indicators of general purchase behavior, including household size and composition, household income, age of the household head, socio-economic status of the household, and region and market size. During the first week of January a self-administered questionnaire was mailed to 10,000 of these households for "Series I" and 20,000 of these households for "Series II." The sample is balanced to oversample lower "return rate" segments, thereby yielding a return sample which is correctly representative of the continental United States based upon these characteristics.

B. Questionnaire

The questionnaires asked the male and female heads of household and up to two other household members who were at least seven years of age to indicate their age, the sports in which they participated in 1992, and the number of days of participation in 1992.

In order to reduce the bias effect that is possible from the order in which the sports were listed, the list was given in alphabetic order to half of the households, and in reverse-alphabetic order to the remaining half of the households.

The response rate for "Series I" was 76%, yielding a final sample of about 15,000 individuals for 1992, while that for "Series II" was 75%, yielding a final sample of about 27,000 individuals.

C. Returns

The sample returns were projected using a two-step process. The first step ensured that the sample returns were correctly representative of the continental United States in terms of state of residence and market size. This was accomplished through the use of a 48-cell weighting matrix defined for both state and MSA market size.

The second step projected the weighted returns to be representative of participation in the entire continental United States. The projection matrix was defined for:

- household size
- gender of household head for single member households
- household head age for each household size break
- household income for each household head age break
- region

III. STATISTICAL NOTES

It is important to note that in basing estimates of a population on a sample drawn from that population, a degree of sampling error is possible. While a number of biases can affect the extent of sampling error, it is to a great degree dependent on the size of the sample. The larger the sample, the more closely the estimate represents the total population.

Sampling error also affects samples of the same size. A sample drawn from a population will result in an estimate for a characteristic of the population, the proportion of baseball players in Nevada for example. If another sample were drawn, it would be likely to include different members of the population. This would yield a slightly different estimate of the proportion of baseball players in Nevada.

To allow judgments and decisions to be made with confidence when using samples, we can determine a confidence interval for the estimate.

A confidence interval is simply a range. A 95% confidence interval for the proportion of baseball players in Nevada is a range in which the estimates for the proportion of baseball players in Nevada would fall 95% of the time, were the study to be done repeatedly. Thus, if we were to estimate the proportion of baseball players in Nevada using 100 similar studies, 95 of those studies would yield an estimate within the 95% confidence interval.

The confidence intervals for measurements of the proportion of participants in each sport in both the "Series I" and "Series II" studies do not exceed +/-1.0% for the total U.S. However, small sample sizes within some states result in much larger confidence intervals, and the report should therefore be used for directional purposes only.

IV. DATA INDICATED IN THE REPORTS

A. Participants

A participant is defined as an individual seven years of age or older who participates in a sport more than once within a year for all sports in both the "Series I" and "Series II" studies except aerobic exercising, bicycle riding, calisthenics, exercise walking, exercising with equipment, running/jogging, step aerobics, swimming, and work-out at club. For these nine fitness sports, participation is defined as six times or more during the year.

The definition of "Frequent," "Occasional" and "Infrequent" participant varies for each sport and is indicated in the report. For sports where the incidence of participation is low, participants are divided into "Frequent" and "Infrequent" only.

B. Means

Following the frequency distributions, the total number of participant days is reported for each sport. The number of participant days for certain sports should be divided by an estimate of the number of participants who play together on a team or in an event in order to calculate the number of games, matches, etc. played.

C. Indexed Participation

On the last line of the report an index of participation is shown, relating state participant proportions to state population proportions. It is calculated by dividing the proportion of participants residing within a state by the proportion of the total U.S. population residing within that state and multiplying by 100. For example, if 6% of all participants in a sport live in a state that represents 3% of the national population, that state's index of participation would be 200(6 divided by 3, times 100). This implies that the population of that state is twice as likely to participate in that sport as the national population.

D. In This Report

Note that the data for individual activities are percentaged both horizontally and vertically. The data, therefore, include three numbers. The first (top) indicates participants in thousands. The second (middle) is the horizontal percentage. The third (bottom) is the vertical percentage.

In the following example:

- aerobic exercising participants numbered 26,875,000 for "TOTAL PARTICIPANTS."
- 433,000 of these were from Alabama, representing 1.6% of participants (the horizontal percent).
- 7,321,000 of all aerobic exercising participants were "FREQUENT" participants, representing 27.2% of participants (the vertical percent).
- 88,000 of all aerobic exercising participants were Alabamans who were "FREQUENT" participants. This represents 1.2% of all "FREQUENT" participants (the horizontal percent) and 20.5% of all Alabaman participants (the vertical percent).

Associate Members of NSGA enjoy these benefits:

If you're *not* an Associate Member of NSGA, join today so that you can take advantage of all these benefits:

- Exhibition and attendance privileges at NSGA World Sports Expo in Chicago...the cost-effective way to sell to thousands of retailers.

- A copy of *The Sporting Goods Market* - the most comprehensive, original research available on consumer purchases of sports equipment and footwear. The report provides unit and dollar consumer purchase information in more than 20 sport categories.

- A subscription to *NSGA Retail Focus* magazine, published monthly to provide members with the latest industry and association news.

- Free use of the exclusive NSGA Information Center, with information specialists to answer your specific questions.

- The *NSGA Sports Participation* surveys, and other NSGA research reports, at specially discounted members-only prices.

- Bold face listing in the *NSGA Buying Guide*.

- Special discounted price for renting mailing lists from the NSGA Information Bank. Target your prospective customers!

- Discounted prices on all NSGA books from the NSGA Learning Center...your convenient source for instructional material on marketing, sales, and management.

- Access to money-saving programs for your business:
    -discounts on long distance telephone service
    -check guarantee service
    -discounts on office supplies
    -Budget Rent A Car

I. INTRODUCTION

"Sports Participation in 1992: LifeCycle Demographics" reports LifeCycle demographics for participants in each of 26 different sports. The LifeCycle demographic segments, developed by the NPD Group and American Demographics, classify households in terms of several demographic characteristics. These segments define a household in broad socioeconomic terms, providing a tool which can shed light on consumer behavior.

Reports included in the study are:

- LifeCycle Segments by Frequency of Participation
- LifeCycle Segments by Sex, Age, Region and MSA Market Size

The report is created by compiling information from the National Sporting Goods Association's "Series I" study and breaking it out by LifeCycle segment.

II. METHODOLOGY

A. Sampling

For "Sports Participation in 1992: LifeCycle Demographics," a mail panel resource of more than 200,000 pre-recruited households was used. The panel is balanced on a number of characteristics determined to be key indicators of general purchase behavior, including household size and composition, household income, age of the household head, socioeconomic status of the household, region and market size. Balancing of the panel is done to oversample lower "return rate" segments, and thereby yield a return sample which is correctly representative of the continental United States based upon these characteristics.

During the first week of January, a self-administered questionnaire was mailed to 10,000 of these households. These households were pre-coded into one of ten different LifeCycle segments based upon the demographic characteristics of the household. These segments were:

- Affluent Singles: single head of household, under 65, top third in per capita income
- Low/Middle Income Singles: single head of household, under 65, bottom two-thirds in per capita income
- Double Income with No Kids (DINKS): two heads of household, under 45, both employed, without children
- Working Parents: two heads of household, under 65, both employed, with children
- Single Parents: single head of household (usually female), under 65, with children
- Affluent Traditional Families: two heads of household, under 65, one spouse employed, with children under 18, top third in per capita income
- Low/Middle Income Traditional Families: two heads of household, under 65, one spouse employed, with children under 18, bottom two-thirds in per capita income
- Affluent Empty Nesters: middle-aged, no children under 18 in household, top third in per capita income
- Low/Middle Income Empty Nesters: middle-aged, no children under 18 in household, bottom two-thirds in per capita income
- Seniors (Age 65+): female head (male head if female head is not present) is 65 or over

B. Questionnaire

The questionnaire asked the male and female heads of household and up to two other household members who are at least seven years of age to indicate their age, sports in which they participated in 1991, 1992, and the number of days of participation in 1992. The sports list included those sports listed in this report's table of contents.

In order to reduce the bias effect that is possible from the order of the sports listed, the list was given in alphabetic order to half of the households, and in reverse-alphabetic order to the remaining half of the households.

The response rate for the survey was 76%, yielding a final sample of 14,992 for 1992.

C. Returns

The sample returns were projected using a two-step process. The first step ensured that the sample returns were correctly representative of the continental United States in terms of state of residence and market size. This was accomplished through the use of a 48-cell weighting matrix defined for both state and MSA market size.

The second step projected the weighted returns to be representative of participation in the entire continental United States. The projection matrix was defined for:

- household size
- household composition for single member households
- age of household head given household size
- household income given age of household head
- region

III. STATISTICAL NOTES

It is important to note that in basing estimates of a population on a sample drawn from that population, a degree of sampling error is possible. The extent of the sampling error is dependent on the size of the sample. The larger the sample, the more closely the estimate represents the total population.

Sampling error also affects samples of the same size. A sample drawn from a population will result in an estimate for a characteristic of the population, the proportion of aerobic exercisers for example. If another sample were drawn, it would be likely to include different members of the population. This would yield a slightly different estimate for the proportion of aerobic exercisers.

To allow judgments and decisions to be made with confidence when using samples, we can determine a confidence interval for the estimate.

A confidence interval is simply a range. A 95% confidence interval for the proportion of aerobic exercisers in the population is a range in which the estimates for the proportion of aerobic exercisers would fall 95% of the time, were the study to be done repeatedly. Thus, if we were to estimate the proportion of aerobic exercisers in the United States using 100 similar studies, 95 of those studies would yield an estimate within the 95% confidence interval.

The confidence intervals for measurements of the proportion of participants in each sport in "Series I" do not exceed +/-1.0%.

IV. DATA INDICATED IN THE REPORTS

A. Participants

A participant is defined as someone seven years of age or older who participates in a sport more than once within a year for all sports in "Series I" except aerobic exercising, bicycle riding, calisthenics, exercise walking, exercising with equipment, running/jogging and swimming. For these seven fitness sports, participation is defined as six times or more during the year.

The definition of "Frequent," "Occasional" and "Infrequent" participant varies for each sport. For sports where the incidence of participation is low, participants are divided into "Frequent" and "Infrequent" only.

B. In This Report

Several features distinguish these reports. The age groupings parallel those found in "The Sporting Goods Market," also published by the National Sporting Goods Association. This allows comparisons between participation and purchases in each age group.

The data for individual activities are percentaged horizontally. The data, therefore, include two numbers. The first (top) indicates participants in thousands. The second (bottom) is the horizontal percentage.

In the example below:

- Participants in aerobic exercising numbered 27,834,00 for "TOTAL RESPONDENTS IN 1992."
- 6,786,000 participants were "FREQUENT" participants.
- 3,179,000 participants were "AFFLUENT SINGLES," representing 11.4% of the total (the horizontal percent).
- 802,000 participants were "AFFLUENT SINGLES" that were "FREQUENT" participants, representing 11.8% of all "FREQUENT" participants (again, the horizontal percent).

C. Index of Participation

Following the frequency distributions in the "LifeCycle Segments by Frequency of Participation" report, an index of participation is reported for each sport. The index relates each LifeCycle segment's participation to national participation. It is obtained by dividing the percent of participants in a segment by the percent of the national population in that segment. For example, if 6% of all participants in a sport are in a segment that represents 3% of the national population, that segment's index of participation would be 200 (6 divided by 3 multiplied by 100). This means that individuals in that segment are twice as likely to participate in that sport as the national population.
